BACKGROUND

The PRISMA diagram for the identification of over 860 articles is presented. Key words selected will be discussed together with arguments for their choice. Over 1500 articles were identified and then culled using a set criteria used to exclude papers. Artificial Intelligence (AI) techniques for the assessment of duplicates etc will be presented. The final papers from the abstract list will be listed and the reasons for their choices will be offered.

CONCLUSION

This Propero registered systematic review is one of the first to look at the outcomes of long COVID clinics and will present a set if ethical and academic issues worthy of consideration for those attempting research into rehabilitation outcomes in long COVID.

Statement of Disclosures

None
